

II. CLAIM AMENDMENTS

1.-32. (Cancelled)

33. (Currently Amended) The first mobile communication terminal of claim 36, wherein the short-range wireless communication transceiver comprises a bluetooth transceiver.

34. (Currently Amended) The first mobile communication terminal of claim 36, wherein the short-range wireless communication transceiver is operable to communicate within an operational low power radio range.

35. (Currently Amended) The first mobile communication terminal of claim 36, wherein the means for detecting whether a second mobile terminal is available for trading the digital collectable card further comprises a means for detecting whether the second mobile terminal has a digital collectable card trading capability.

36. (Currently Amended) A first mobile communication terminal comprising:

circuitry for trading a digital collectable card associated with a user of the first mobile terminal;

~~means for detecting a detector arranged to detect~~ whether a second mobile terminal is available for trading the digital collectable card; and

a short-range wireless communication transceiver for directly communicating with the second mobile terminal for trading the digital collectable card,

wherein the ~~means for detecting whether a second mobile terminal is available for trading the digital collectable card further comprises a means for detecting~~detector is further arranged to detect the availability of a particular digital collectable card.

37. (Currently Amended) The first mobile communication terminal of claim 36, further ~~comprising a means for determining~~ arranged to determine whether the first and second mobile terminals are in the same cell of a mobile communication network.

38. (Currently Amended) The first mobile communication terminal of claim 36, further ~~comprising a means for transferring~~ arranged to transfer confirmation and registration messages to a server administering the digital collectable card via a mobile communications network.

39. (Currently Amended) The first mobile communication terminal of claim 36, further ~~comprising a means for determining~~ arranged to determine whether the second mobile terminal is in the vicinity of the first mobile terminal.

40. (Currently Amended) The first mobile communication terminal of ~~claim 39, wherein the means for determining whether the second mobile terminal is in the vicinity of the first mobile terminal comprises~~ claim 36, further arranged to provide a short-range wireless communication between the first and second mobile terminals.

41. (Currently Amended) The first mobile communication terminal of claim 36, further ~~comprising a means for determining~~ arranged to determine whether another digital collectable card is available.

42. (Currently Amended) The first mobile communication terminal of claim 36, wherein the first and second mobile terminals are operable to exchange messages proposing a meeting to trade the digital collectable card.

43. (Cancelled)

44. (Previously Presented) The method of claim 45, further comprising detecting whether the second mobile terminal has a digital collectable card trading capability.

45. (Previously Presented) A method comprising:

trading a digital collectable card associated with a user of a first mobile terminal, including:

detecting whether a first mobile terminal is in the vicinity of a second mobile terminal;

detecting whether a second mobile terminal is available for trading a digital collectable card, including detecting the availability of a particular digital collectable card; and

communicating within an operational range of short range wireless communications directly between the first and second terminals for trading the particular digital collectable card.

46. (Previously Presented) The method of claim 45, wherein detecting whether the first mobile terminal is in the vicinity of the second mobile terminal comprises determining whether the first and second mobile terminals are in the same cell of a mobile communication network.

47. (Previously Presented) The method of claim 45, wherein detecting whether the first mobile terminal is in the vicinity of the second mobile terminal comprises exchanging a short-range wireless communication between the first and second mobile terminals.

48. (Previously Presented) The method of claim 45, further comprising transferring confirmation and registration messages to a server administering the digital collectable card via a mobile communications network.

49. (Previously Presented) The method of claim 45, further comprising exchanging messages proposing a meeting to trade the digital collectable card.

50. (Previously Presented) A system for trading a plurality of digital collectable cards comprising:

a first mobile terminal having a user associated with a first card of the plurality of digital collectable cards, wherein the system is configured to detect the availability of the first card;

a second mobile terminal having a second user, the second mobile terminal being capable for associating the second user with the first card, the second mobile terminal operable to determine if the first mobile terminal is in the vicinity of the second mobile terminal;

wherein the system is configured to detect whether the second mobile terminal is available for trading the first card, and wherein the first and second mobile terminals both comprise a short-range wireless communication transceiver for directly communicating between the first and second mobile terminals for trading the first card.

51. (Previously Presented) The system of claim 50, wherein the short-range wireless communication transceivers comprise bluetooth transceivers.

52. (Previously Presented) The system of claim 50, further comprising:

a mobile communication network; and

a means for determining whether the first and second mobile terminals are in the same cell of the mobile communication network.

53. (Currently Amended) The first mobile communication terminal of claim 36 further comprising:

a transceiver for cellular mobile wireless communication over a cellular mobile communication network;

an input user interface to request the digital collectable card from the cellular mobile communication network;

a memory to store the digital collectable card received at the first mobile terminal;

an output user interface to display the received digital collectable card; and

a processor configured to transmit user identity information to a digital collectable card server over the cellular mobile communication network and a request to receive a particular digital collectable card from the digital collectable card server, wherein the digital collectable card is adapted to be associated with the user based on the user identity information transmitted over the cellular mobile communication network from the first mobile terminal.

54. (Currently Amended) The ~~first~~ mobile communication terminal of claim 53, wherein the user identity information includes a password.

55. (New) A mobile communication terminal, comprising:

circuitry arranged to obtain a digital collectible card data file associated with the mobile communication terminal,

a short-range wireless communication transceiver arranged to detect whether another mobile communication terminal is in an operational range with the mobile communication terminal,

the short-range wireless communication transceiver further arranged to detect a request for availability of the digital collectible card data file, and

the short-range wireless communication transceiver further arranged to communicate so that the digital collectible card data file can be traded with the another mobile communication terminal.

56. (New) The mobile communication terminal according to claim 55, further comprising a second wireless communication transceiver arranged to communicate a registration message of the trade to a network entity.

57. (New) A method for mobile communication comprising:

obtaining a digital collectible card data file associated with a mobile communication terminal,

detecting whether another mobile communication terminal is in an operational range of a short range wireless communication with the mobile communication terminal,

detecting a request for availability of the digital collectible card data file, and

communicating within the operational range of the short range wireless communication so that the digital collectible card data file can be traded with the another mobile communication terminal.

58. (New) The method according to claim 56, further comprising communicating a registration message of the trade to a network entity.

59. (New) A method comprising:

associating a digital collectible card data file with a first mobile communication terminal,

detecting whether the first mobile communication terminal is in an operational range of a short range wireless communication with a second mobile communication terminal, and further detecting availability of the digital collectible card data file, and

communicating within the operational range of the short range wireless communication between the first and the second mobile communication terminals in order to trade the digital collectible card data file.

60. (New) The method according to claim 59, further comprising communicating a registration message of the trade to a network entity.

61. (New) The method according to claim 59, wherein associating the digital collectible card data file with the first mobile communication terminal is performed at a network entity.

62. (New) A system comprising:

a first mobile communication terminal having a short-range wireless communication transceiver,

a second mobile communication terminal having a short-range wireless communication transceiver,

a network entity arranged to associate a digital collectible card data file with the first mobile communication terminal,

wherein the short-range wireless communication transceiver of the first mobile communication terminal is arranged to detect whether the second mobile communication terminal is in an operational range the first mobile communication terminal,

the short-range wireless communication transceiver of the first mobile communication terminal being arranged to detect a request for availability of the digital collectible card data file from the second mobile communication terminal, and

the short-range wireless communication transceiver of the first mobile communication terminal arranged to communicate in order to trade the digital collectible card data file to the second mobile communication terminal.
